

Aufgabe 1:

Gegeben:

$$n = 0,013 \text{ s/m}^{1/3}$$

$$Q = 30 \text{ m}^3/\text{s}$$

$$S_0 = j$$

→ Berechnung des Querschnitts

$$A = ABFG + BEZH + ZGR = (2 \cdot 3,6) + (2 \cdot 1,6) + \left(\frac{1}{2} \cdot 2 \cdot 2\right) = \\ = 7,2 + 3,2 + 2 = 12,4 \text{ m}^2$$

$$P = AG + GF + FR + ZH = 3,6 + 2 + \sqrt{8} + 1,6 \approx 10,08 \text{ m.}$$

$$\text{dann } RZ = \sqrt{GR^2 + EZ^2} = \sqrt{2^2 + 2^2} = \sqrt{8}$$

Aus:

$$R = \frac{12,4}{10,08} \approx 1,23 \text{ m}$$

$$\text{Gesucht! } Q = \frac{1}{n} AR^{2/3} S_0^{1/2} =$$

$$\Rightarrow S_0^{1/2} = \frac{n Q}{A R^{2/3}} \Rightarrow S_0^{HE} = \left( \frac{0,013 \cdot 30}{12,4 \cdot 1,23^{2/3}} \right)^2$$

$$\Rightarrow S_0 = 0,000751$$

Άσκηση 2:

Διάλεξαι:

$$n = 0,015 \text{ m}^{1/3}$$

$$Q = 57 \text{ m}^3/\text{s}$$

$$S = 0,0078$$

$$b = 10 \text{ m}$$

$$A = 10y_n - \left( \frac{1}{2} \cdot S \cdot S \cdot \tan 10^\circ \right) = 10y_n - 4,408$$

\* Αφού από το οδηγό είθαντο  $b_y$ , τα σημεία των δύο τροχίων.

\* Έντετα ορίσκων ωραίον περίφερο.

$$P = 2 \cdot (y_n - x) + 2 \sqrt{\left(\frac{b}{2}\right)^2 + x^2} \Rightarrow P = 2y_n - 1,76 + 10,15 = 2y_n + 8,39$$

όπου  $x = S \cdot \tan 10^\circ = 0,88 \text{ m}$

$$\text{Οπότε } R = \frac{A}{P} = \frac{10y_n - 4,408}{2y_n + 8,39}$$

$$\text{Ισχύει } Q = \frac{1}{n} A R^{2/3} S_0^{1/2} \Rightarrow \frac{Q_n}{S_0^{1/2}} = A R^{2/3} \Rightarrow$$

$$\Rightarrow \frac{57 \cdot 0,015}{\sqrt{0,0078}} = (10y_n - 4,408) \cdot \left( \frac{10y_n - 4,408}{2y_n + 8,39} \right)^{2/3}$$

Με δυνήσκες ορίσκων  $y_n = 2,11 \text{ m}$

Τραπεζοειδής Διαστάση

Άσκηση 32

$$\text{Έχω } b = 5,5 \text{ m}$$

$$f_n = \frac{Q_n}{b^{2/3} \sqrt{S_0}} \approx 0,1719$$

→ Νέων οίκοι διαγράφει

$$\text{για } z = m = 1,5 \text{ γ } f_n = 0,1719$$

$$\text{Ερώτηση } \text{ το } \frac{y_0}{b} = 0,3187 \Rightarrow$$

$$\Rightarrow y_0 = 5,5 \cdot 0,3187 = 1,753 \text{ m}$$

Διανομή:

$$Q = 30,5 \text{ m}^3/\text{s}$$

$$S_0 = 0,0007$$

$$n = 0,014 \text{ s/m}^{1/3}$$

$$y = ?$$

Ερώτηση 4:

$$Q = \frac{1}{h} A R^{2/3} S_0^{1/2}, \quad A = (b + my) y = (5,5 + 1,5 \cdot 1,753) \cdot 1,753, \quad \Rightarrow A = 14,25 \text{ m}^2$$

Αντικαθίστω:

$$Q = \frac{1}{0,014} \cdot 14,25 \cdot 1,90 \cdot \sqrt{0,0007} \Rightarrow R = b + 2y \sqrt{T+m^2} = 5,5 + 2 \cdot 1,753 \cdot \sqrt{1+1,5^2} \Rightarrow$$

$$\Rightarrow Q \approx 30,5 \text{ m}^3/\text{s}$$

$$\Rightarrow H = 11,82 \text{ m}$$

$$R = A = 1,20 \text{ m}$$

η αλλαγής

$$n = \frac{AR^{2/3} S^{1/2}}{q} = \frac{14,25 \cdot 1,90^{4/3} \cdot \sqrt{10007}}{30,5} = \boxed{0,014 \text{ s/m}^{2/3}}$$

↓  
àonløs oppgave

Fra følgende rapport i QWFI:

$$b/y > 3 \Rightarrow \frac{S.S}{T_1 \cdot 753} > 3 \text{ OK. (Kostet, nokså)}$$

Trikkevinn snittet:

$$\text{I QWFI } \frac{Q_n}{S_0^{1/2}} = AR^{2/3} \Rightarrow$$

$$\Rightarrow \frac{30,5 + 0,014}{\sqrt{10,0007}} = (S.S + 1,5 \cdot y) \cdot \frac{(S.S + 1,5y) \cdot y}{(S.S + 2y) \cdot \sqrt{1+L^2}}$$
